

openSUSE Kubic

The Container Platform by openSUSE

<https://kubic.opensuse.org>

Sarah Julia Kriesch

sarah.kriesch@opensuse.org

Agenda

- About me
- The openSUSE project
- openSUSE Kubic
- Features
- Transactional Updates
- Velum as a Dashboard
- openSUSE Leap and Kubic
- Podman
- How to contribute

About me

- Student in Computer Science (B.Sc.), TH Nürnberg
- Student Representative in Senate/ University Council
- Student Representative in AG Study Plan, AG Laboratories
- Founder AG Open Source (Educator + Trainer), TH Nürnberg
- Global Translation Coordinator, QA, Wiki, Advocate (openSUSE) at openSUSE
- Chairman at One Week Experience e.V. (One Week Student)

openSUSE Kubic project

- Container as a Service Platform
- MicroOS, based on openSUSE Tumbleweed
- Velum, Cluster Bootstrapper & Cluster Dashboard
- Based on SUSE Container as a Service Platform (CaaSP)

Features

- Transactional Updates
- Latest packages with openSUSE Tumbleweed
- Based on Podman
- Created with Docker base(part of Atomic Project)

Transactional Updates

- Is Atomic:
 - Fully applied or not at all
 - Update does not influence the running system
- Can be rolled back:
 - A failed or incompatible update can be discarded and the previous system can be restored

Requirements

- Btrfs root filesystem with snapper (snapshots)/
rollback enabled
- zypper
- btrfsprogs

Snapshots vs. Transactional Updates

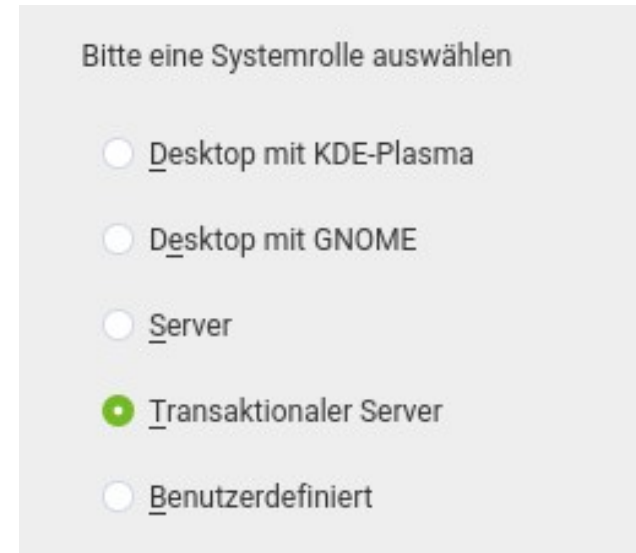

Transactional Update

- Clone of current root to ro
- Change rw
- zypper up
- Change to ro
- “Rollforward” with btrfs subvol set-default
- After reboot change / update executed
- Quickly rollback

Executing Transactional Updates

- Update/Upgrade:
transactional-update
[up|dup|patch]
- Installation/ Remove /
Update 1 package:
transactional-update pkg
[install|remove|update]
pkg
- Rollback:
transactional-update
rollback

Project Atomic

- Container Tools
(incl. Compose)
- Integrated docker
commands
- Easy to use with
container experience

Velum as a Dashboard

The screenshot displays the SUSE CaaS Platform dashboard. At the top, there is a navigation bar with 'SUSE CaaS Platform', 'Home', 'Settings', and a 'Logout' button. A yellow warning banner states: 'A supported deployment of SUSE CaaS Platform requires a minimum of three nodes.' Below this is the 'Cluster Status' section, which includes a 'Summary' table and a 'Nodes' table.

Summary

Total nodes	2	Updates	Manual
Master nodes	1	# of nodes w/ outdated software	0
New nodes	0		

Nodes

Online	Applied	ID	Hostname	Role	Actions
		4f16ea66e6bc485dbc030b2b5aa9f905	master-0.devenv.caasp.suse.net	<input checked="" type="checkbox"/> master	
		02534239728c40a6919b21ffb678b597	worker-0.devenv.caasp.suse.net	<input type="checkbox"/> worker	

Pending Nodes

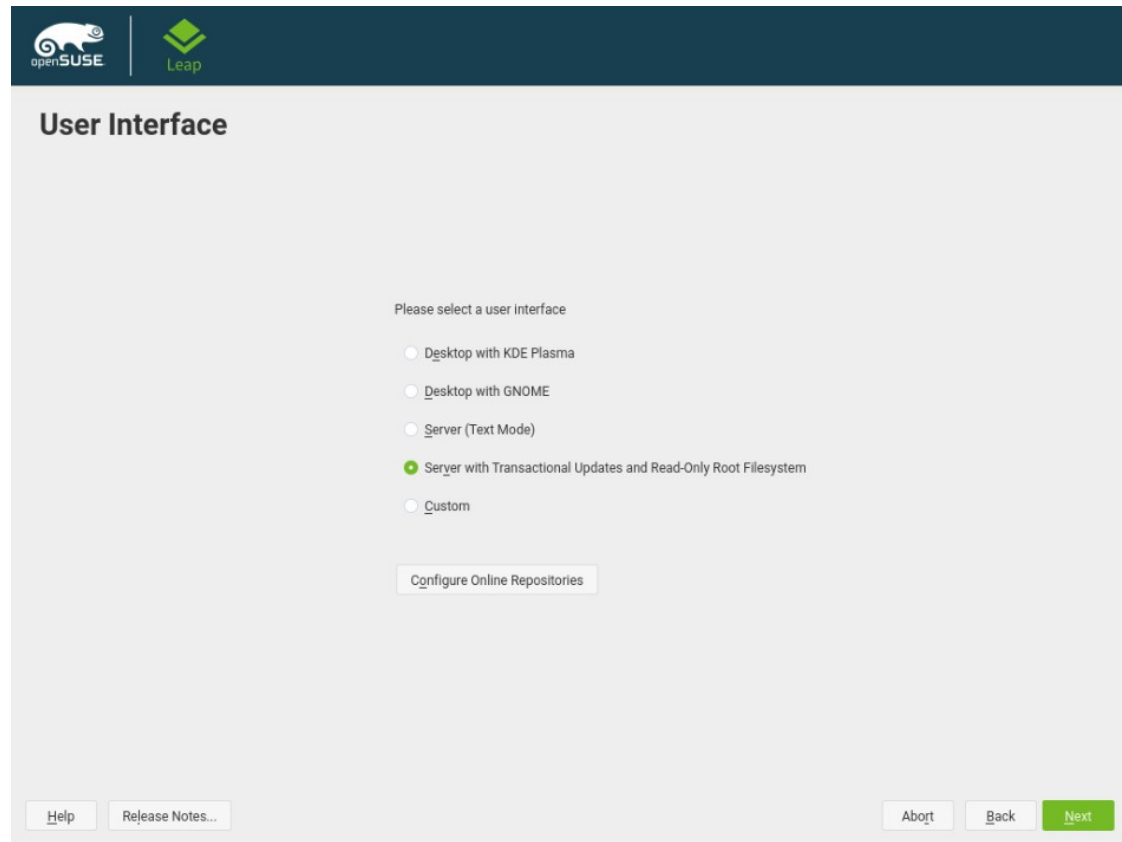

You currently have no nodes to be accepted for bootstrapping.

SUSE CaaS Platform 3.0.0 | © SUSE Linux 2018

How does Leap profit from Kubic?

- Transactional Updates available in Tumbleweed and Leap

kubeadm

- toolkit produced by Kubernetes
- Creation of kubeadm nodes for a cluster
- Initialization of the network and joining a node:
- *kubeadm init --pod-network-cidr=10.244.0.0/16*
- *kubeadm join*

openSUSE MicroOS

- System designed for running containers and optimised for large deployments.
- Includes Docker Open Source Container Runtime by default

kubeadm Node

- MicroOS plus kubeadm kubernetes bootstrapping tool
- Create a cluster with ``kubeadm init``
- Join a cluster with ``kubeadm join``

kubicctl

- Adding Worker Nodes:
 - *kubicctl node add node1,node2,...*
- Verifying the cluster:
 - *kubectl get nodes*

Verification of the cluster

```
master:~ # kubectl get nodes
NAME        STATUS    ROLES    AGE      VERSION
master     Ready    master   8m       v1.11.1
node1      Ready    <none>   37s     v1.11.1
master:~ #
```

Kubic Node Roles

- Kubic Admin Node:
 - kubecd
(daemon which communicates via gRPC with clients and setup of Kubernetes network)
 - salt-master (for node management via Dashboard)
 - Kubernetes Master Node
- Kubic Loadbalancer Node:
 - MicroOS without container runtime
 - haproxy installed
- Additional Kubic Node:
 - Additional Master for HA
 - Worker Node

Podman

- Alternative container engine instead of docker
- Same commands as docker
- Daemonless and rootless containers possible
- Container Manager as docker-compose
- Sharing of one network namespace
- Compatible with multiple image formats including the OCI and Docker image formats

Pods

- 1 Kubernetes pod in 1 Linux namespace and the same cgroup
- Flexible combinations of services possible (webserver, github pull, database, ...)

Daemonless

- Docker daemon is (mostly) executed by root
- Podman is working without central daemon
- Additional process *common* is monitoring and gives correct start parameters for the container runtime

Rootless

- Start of a container without root privileges
 - Mapping of the UID in the namespace
 - Using root in a container possible (isolating root)
 - User in the container has default access on host system
-
- Docker offers that since version 19.03

Example of a rootless podman process

```
$ podman run --name nginx -d -p 8080:80 -v ~/public_html:/usr/share/nginx/html:ro nginx
```

Podman process (euid=\$UID)

Join existing user+mount namespace, or create one

Podman process (euid=0)

Setup the network namespace with slirp4netns

Setup the storage and the fuse-overlays mount

common

OCI runtime

container process

Podman commands – as docker

- podman run
- podman exec
- podman info
- podman logs
- podman ps
- podman cp
- podman rm
- podman poll
- podman push
- podman build
- podman image
- podman images
- podman commit
- podman history
- podman stop
- podman start
- podman volume

Podman (only) commands

- podman generate kube
- podman container cleanup
- podman container exists
- podman container restore
- podman image exists
- podman pod create
- podman pod kill
- podman pod ps
- podman pod pause
- podman pod restart

“Do you wanna become a Contributor?”

Packaging

- Creation of packages with the Open Build Service
- Submit to openSUSE Factory
 - > openSUSE Tumbleweed
- <https://build.opensuse.org/project/show/devel:kubic>

Development of openSUSE Kubic

- Github contributions:
 - <https://github.com/kubic-project>

Quality Assurance

- Test it!
- Try it!
- Perform it!
- Report bugs!
- Bugzilla:
<https://bugzilla.opensuse.org/buglist.cgi?component=Kubic&product=openSUSE%20Tumbleweed>

- Podman Usage:

<https://github.com/containers/libpod/blob/master/transfer.md>

The background features a complex geometric pattern of overlapping shapes. A large teal shape occupies the upper left, a blue shape is at the bottom left, and a green shape is on the right. These shapes are separated by white, irregular borders that create a sense of depth and movement.

Questions?

The background features a large, dark green arrow pointing to the right, which is part of a larger geometric pattern of interlocking shapes in shades of green and blue. The text is positioned on the left side of the dark green arrow.

openSUSE Summit 2020

Dublin

May 27 – 28, 2020
